

SKELETAL RECONSTRUCTION CAGES

Abstract

5 The present invention relates to skeletal reconstruction cages and a method of
providing variable fit for a skeletal reconstruction cage. The skeletal reconstruction cages
include a central body having first and second ends, a first end cap coupled to one end of the
central body, and a second end cap coupled to the other end of the central body. At least two
of the central body, first end cap, and second end cap are formed from bone. Each of the
10 central body, first end cap, and second end cap may be provided in different sizes so that
cages with varying overall heights, and related angulations, may be created.
